NOVEL BICYCLIC HYDROXAMATES AS INHIBITORS OF HISTONE DEACETYLASE

BACKGROUND OF THE INVENTION

10 Field of the Invention

The present invention is directed to certain bicyclic hydroxamate derivatives that are inhibitors of histone deacetylase and are therefore useful in the treatment of diseases associated with histone deacetylase activity. Pharmaceutical compositions and processes for preparing these compounds are also disclosed.

15

State of the Art

Interest in histone deacetylase enzymes (HDACs) as targets for pharmaceutical development has centered on the role of HDACs in regulating genes associated with cell-cycle progression and the development and progression of cancer (reviewed in Kramer et. al. 2001).
20 *Trends Endocrinol. Metab.* 12:294-300). Several studies have shown that treatment of various cell lines with HDAC inhibitors leads to hyper acetylation of histone proteins and cell-cycle arrest in late G₁ phase or at the G₂/M transition. Genes involved in the cell cycle that have been shown to be up regulated by HDAC inhibitors include p21, p27, p53 and cyclin E. Cyclin A and cyclin D have been reported to be down regulated by HDAC inhibitors. In tumor cell
25 lines, several studies have shown that treatment with HDAC inhibitors can lead to growth inhibition, growth arrest, terminal differentiation and/or apoptosis. *In vivo* studies have demonstrated growth inhibition of tumors and a reduction in tumor metastasis as a result of treatment with HDAC inhibitors.

The clearest link between abnormal HDAC activity and cancer occurs in acute
30 promyelocytic leukemia. In this condition, a chromosomal translocation leads to the fusion of the retinoic acid receptor RAR α with the promyelocytic leukemia (PML) or promyelocytic leukemia zinc-finger (PLZF) proteins. Both PML-RAR α and PLZF-RAR α promote the progression of leukemia by repressing retinoic acid-regulated genes through the abnormal recruitment of SMRT-mSin3-HDAC complex (Lin et. al., 1998, *Nature* 391:811-814; Grignani et al., 1998, *Nature* 391:815-818). Whereas the PML-RAR α form of the disease is treatable with retinoic acid, the PLZF-RAR α form is resistant to this treatment. For a patient with the retinoic acid-resistant form of the disease, the addition of the HDAC inhibitor sodium butyrate to the dosing regimen led to complete clinical and cytogenetic remission (Warrell et al., 1998,

5 *J.Natl.Cancer.Inst.* 90:1621-1625). HDACs have also been associated with Huntington's disease (Steffan, et al., *Nature* 413:739-744, "Histone deacetylase inhibitors arrest polyglutamine-dependent neurodegeneration in Drosophila").

In summary, an increase in HDAC activity contributes to the pathology and/or symptomatology of a number of diseases. Accordingly, molecules that inhibit the activity of

10 HDAC are useful as therapeutic agents in the treatment of such diseases.

Release of the active ingredient occurs *in vivo*. Prodrugs can be prepared by techniques known to one skilled in the art. These techniques generally modify appropriate functional groups in a given compound. These modified functional groups however regenerate original functional groups by routine manipulation or *in vivo*. Prodrugs of compounds of Formula I include 30 compounds wherein a hydroxy, amidino, guanidino, amino, carboxylic, or a similar group is modified. Examples of prodrugs include, but are not limited to esters (e.g., acetate, formate,

The starting materials and the intermediates of the reaction may be isolated and purified if desired using conventional techniques, including but not limited to filtration, distillation, crystallization, chromatography and the like. Such materials may be characterized using conventional means, including physical constants and spectral data.

35 Unless specified to the contrary, the reactions described herein take place at atmospheric pressure over a temperature range from about -78 °C to about 150 °C, more preferably from about 0 °C to about 125 °C and most preferably at about room (or ambient) temperature, e.g., about 20 °C.

5 Compounds of formula I can be prepared by the procedure illustrated and described in Schemes A and B below.

Scheme A

10

In general, compounds of Formula I where R¹-R⁵, Ar¹ and Ar² are as defined in the Summary of the Invention can be prepared by the procedure illustrated above and described in detail below.

Reaction of a compound of formula 1 (where X is halo such as chloro, bromo, or iodo and R is hydrogen or alkyl such as methyl, ethyl, and the like) with a boronic acid compound of formula 2 where Ar², R³-R⁵ are as defined in the Summary of the Invention provides a compound of formula 5. The coupling reaction is carried out in the presence of a palladium catalyst such as tetrakis(triphenylphosphine)palladium(0) and an inorganic base such as potassium carbonate. Suitable solvents are aromatic organic solvents such as benzene, toluene, and the like. Alternatively, compound 5 can be prepared by reacting a compound of formula 3 with a compound of formula 4 (where X, Ar², R³-R⁵ are as defined above) under the reaction conditions described above.

Compounds of formula 2 and 4 such as 2-, 3-methoxyphenylboronic acid, 2,4-dichlorophenylboronic acid, 3,5-dichlorophenylboronic acid, 3-formylphenylboronic acid, 5-chloro-2-methoxyphenylboronic acid, 3-nitrophenyl boronic acid, 4-methylbenzoate phenylboronic acid, 3-methoxyphenylboronic acid, 4-methoxycarbonylphenyl boronic acid, 4-

5 carboxyphenylboronic acid are commercially available. Heteroaryl boronic acids are also commercially available. Compounds of formula 1 and 3 are either commercially available or they can be prepared by methods well known in the art. For example, ethyl 4-bromobenzoate, 3-bromophenyl, methyl 4-bromophenylacetate, 3-bromobenzylcarbamic acid benzyl ester, and 4-bromobenzoic acid are commercially available. Ethyl 3-bromo-5-nitrobenzoate can be
10 prepared from 3-nitrobenzoic acid by first brominating the acid with a suitable brominating agent such as *N*-bromosuccinimide in a mixture of trifluoroacetic acid and sulfuric acid to obtain 3-bromo-5-nitrobenzoic acid and then esterifying the carboxy group under conditions well known in the art. 3-Nitro-5-propoxymethylbromobenzene can be prepared from 3-nitrobenzaldehyde by first brominating it with *N*-bromosuccinimide as described above, to give
15 3-bromo-5-nitrobenzaldehyde. Reduction of the aldehyde group with a suitable reducing agent such as sodium borohydride then provides 3-bromo-5-nitrobenzylalcohol with upon treatment with propyl iodide in the presence of a suitable base such as sodium hydride then provides the desicred compound.

A compound of formula 5 can optionally be converted to a compound of formula 6
20 where any of the R³, R⁴, and R⁵ groups have been modified prior to converting it to a compound of Formula I. Some such examples are:

A compound of formula 5 where any of the R³, R⁴, and R⁵ is -X-R⁶ where X is -NR⁸-,-NR⁹CO-, NR¹¹SO₂-, -NR¹³CONR¹⁴- or -NR¹⁵SO₂NR¹⁶- where R⁶, R⁸, R⁹, R¹¹, R¹³, R¹⁴, R¹⁵, and R¹⁶ are as defined in the Summary of the invention can be prepared from a corresponding
25 compound of formula 6 where any of the R³, R⁴, and R⁵ is nitro by first reducing the nitro group to an amino by methods well known in the art and then reacting the amino group with an alkylating agent, acylating agent, sulfonylating agent, carbamoyl halide or sulfamoyl halide respectively, under the reaction conditions well known in the art. For example, the above reactions can be carried out in the presence of a base such as triethylamine, *N,N*-
30 diisopropylethylamine, pyridine, and the like and in a suitable solvent such as dichloromethane, tetrahydrofuran, dioxane, *N,N*-dimethylformamide, and the like. A detailed description of synthesis of compounds of Formula I by this procedure is provided in working examples below and in U.S. Patent 6,136,844, the disclosure of which is incorporated herein by reference in its entirety.

35 A compound of formula 6 where any of the R³, R⁴, and R⁵ is -(alkylene)-NR⁷R⁸ where R⁸ is as defined in the Summary of the Invention and R⁷ is alkyl, optionally substituted phenylalkyl, optionally substituted phenoxyalkyl, optionally substituted phenylalkenyl, optionally substituted phenylaminoalkyl, optionally substituted heteroaralkyl, optionally

5 substituted heteroaryloxyalkyl, optionally substituted heterocycloalkylalkyl, or cycloalkylalkyl can be prepared by reacting a compound of formula 5 where any of the R³, R⁴, and R⁵ is a formyl group with an amine of formula R⁷NH₂ under reductive amination reaction conditions.

A compound of formula 6 where any of the R³, R⁴, and R⁵ is hydroxy can be prepared from a corresponding compound of formula 5 where any of the R³, R⁴, and R⁵ is alkoxy by 10 hydrolysis of the alkoxy group. Suitable dealkylating agents are boron trichloride, and the like.

A compound of formula 6 where any of the R³, R⁴, and R⁵ is -CONR¹⁰R⁶ or -(C₁₋₆-alkylene)-CONR¹⁴R⁷ where R⁶ and R⁷ are as defined in the Summary of the invention can be prepared by reacting a corresponding compound of formula 5 where any of the R³, R⁴, and R⁵ is a carboxy or carboxyalkyl group with a an amine under conditions described above.

15 Compounds of formula 5 any of the R³, R⁴, and R⁵ is a carboxy or carboxyalkyl group can be prepared by reacting a compound of formula 3 such as bromobenzoic acid or bromophenylacetic acid with a compound of formula 4 where R is alkyl.

Compound 5 or 6 is converted to an acid of formula 7 under basic hydrolysis reaction conditions. Typical bases that are used are aqueous sodium hydroxide, potassium hydroxide, 20 and the like. The reaction is carried out in an alcoholic solution such as methanol, ethanol, and the like. Compound 7 is then converted to a compound of Formula I by first reacting 5 with a halogenating agent such as oxalyl chloride, sulfonyl chloride, and then treating the resulting acid halide with a hydroxyamine of formula NHR²OR¹ where R¹ and R² are as defined in the Summary of the Invention. A compound of Formula I where R² is not hydrogen can also be 25 prepared by reacting a corresponding compound of Formula I where R² is hydrogen with an alkylating agent under conditions well known in the art. Other methods of preparing compounds of Formula I from compound 7 are analogous to the methods disclosed in U.S. Patent 5,998,412 the disclosure of which is incorporated herein by reference in its entirety.

A compound of Formula I can be converted to another compounds of Formula I. For 30 example, a compound of Formula I where any of the R³, R⁴, and R⁵ is -X-R⁶ where X is -NR⁸-,-NR⁹CO-, NR¹¹SO₂-, -NR¹³CONR¹⁴- or -NR¹⁵SO₂NR¹⁶- where R⁶, R⁸, R⁹, R¹¹, R¹³, R¹⁴, R¹⁵, and R¹⁶ are as defined in the Summary of the invention can be prepared from a corresponding compound of Formula I where any of the R³, R⁴, and R⁵ is nitro as described previously. A compound of Formula I where any of the R³, R⁴, and R⁵ is -CONR¹⁰R⁶ or -(C₁₋₆-alkylene)-CONR¹⁴R⁷ where R⁶ and R⁷ are as defined in the Summary of the invention can be prepared by 35 reacting a corresponding compound of Formula I where any of the R³, R⁴, and R⁵ is a carboxy or carboxyalkyl group as described previoualy

5 Alternatively, compounds of Formula I where Ar² is heteroaryl such as benzimidazole can be prepared as described in working Examples 5, 6 and 12 below.

Compound of Formula I can also be synthesized using hydroxylamine Wang resin as illustrated and described in Scheme B below.

10

Scheme B

Treatment of pre-swelled hydroxylamine Wang resin with an acid of formula 7 where R³, R⁴ and R⁵ are as defined in the Summary of the Invention except a carboxy group in the 15 presence of a coupling agent such as HATU and an organic base such as triethylamine, diisopropylethylamine, and the like provides a resin bound compound of formula 8. The reaction is carried out in suitable organic solvent such as N,N-dimethylformamide and at room temperature.

Compounds of formula 7 can be prepared as described in Scheme A above. Compound 20 8 is optionally converted to a compound of formula 9 where any of the R³, R⁴ and R⁵ groups are modified as described in Scheme A above.

Compound 8 or 9 is then treated with a strong acid such as trifluoroacetic acid to provide a compound of Formula I.

A detailed synthesis of a compound of Formula I utilizing this procedure is provided in 25 Example 13 below.

Administration and Pharmaceutical Compositions

15

In general, the compounds of this invention will be administered in a therapeutically effective amount by any of the accepted modes of administration for agents that serve similar utilities. The actual amount of the compound of this invention, i.e., the active ingredient, will depend upon numerous factors such as the severity of the disease to be treated, the age and relative health of the subject, the potency of the compound used, the route and form of administration, and other factors.

20

Therapeutically effective amounts of compounds of Formula I may range from approximately 0.1-50 mg per kilogram body weight of the recipient per day; preferably about 0.5-20 mg/kg/day. Thus, for administration to a 70 kg person, the dosage range would most preferably be about 35 mg to 1.4 g per day.

25

In general, compounds of this invention will be administered as pharmaceutical compositions by any one of the following routes: oral, systemic (e.g., transdermal, intranasal or by suppository), or parenteral (e.g., intramuscular, intravenous or subcutaneous) administration. The preferred manner of administration is oral or parenteral using a convenient daily dosage regimen, which can be adjusted according to the degree of affliction. Oral compositions can take the form of tablets, pills, capsules, semisolids, powders, sustained release formulations, solutions, suspensions, elixirs, aerosols, or any other appropriate compositions.

30

The choice of formulation depends on various factors such as the mode of drug administration (e.g., for oral administration, formulations in the form of tablets, pills or capsules are preferred) and the bioavailability of the drug substance. Recently, pharmaceutical formulations have been developed especially for drugs that show poor bioavailability based upon the principle that bioavailability can be increased by increasing the surface area i.e., decreasing particle size. For example, U.S. Pat. No. 4,107,288 describes a pharmaceutical formulation having particles in the size range from 10 to 1,000 nm in which the active material is supported on a crosslinked matrix of macromolecules. U.S. Pat. No. 5,145,684 describes the production of a pharmaceutical formulation in which the drug substance is pulverized to nanoparticles (average particle size of 400 nm) in the presence of a surface modifier and then

5 dispersed in a liquid medium to give a pharmaceutical formulation that exhibits remarkably high bioavailability.

The compositions are comprised of in general, a compound of Formula I in combination with at least one pharmaceutically acceptable excipient. Acceptable excipients are non-toxic, aid administration, and do not adversely affect the therapeutic benefit of the

The instant compounds are also useful, alone or in combination with platelet
15 fibrinogen receptor (GP IIb/IIIa) antagonists, such as tirofiban, to inhibit metastasis of
cancerous cells. Tumor cells can activate platelets largely via thrombin generation. This
activation is associated with the release of VEGF. The release of VEGF enhances
metastasis by increasing extravasation at points of adhesion to vascular endothelium
(Amirkhosravi, Platelets 10, 285-292, 1999). Therefore, the present compounds can serve
20 to inhibit metastasis, alone or in combination with GP IIb/IIIa) antagonists. Examples of
other fibrinogen receptor antagonists include abciximab, eptifibatide, sibrafiban, lamifiban,
lotrafiban, cromofiban, and CT50352.

If formulated as a fixed dose, such combination products employ the compounds of
this invention within the dosage range described above and the other pharmaceutically
25 active agent(s) within its approved dosage range. Compounds of the instant invention may
alternatively be used sequentially with known pharmaceutically acceptable agent(s) when a
combination formulation is inappropriate.

The term administration and variants thereof (e.g., "administering" a compound) in
reference to a compound of the invention means introducing the compound or a prodrug of
30 the compound into the system of the animal in need of treatment. When a compound of the
invention or prodrug thereof is provided in combination with one or more other active
agents (e.g., a cytotoxic agent, etc.), "administration" and its variants are each understood
to include concurrent and sequential introduction of the compound or prodrug thereof and
other agents.

35 As used herein, the term "composition" is intended to encompass a product
comprising the specified ingredients in the specified amounts, as well as any product which
results, directly or indirectly, from combination of the specified ingredients in the specified
amounts.

5 The compounds of the instant invention may also be co-administered with other well known therapeutic agents that are selected for their particular usefulness against the condition that is being treated. For example, the compounds of the instant invention may also be co-administered with other well known cancer therapeutic agents that are selected for their particular usefulness against the condition that is being treated. Included in such
10 combinations of therapeutic agents are combinations of the farnesyl-protein transferase inhibitors disclosed in US Patent 6,313,138 and an antineoplastic agent. It is also understood that such a combination of antineoplastic agent and inhibitor of farnesyl-protein transferase may be used in conjunction with other methods of treating cancer and/or tumors, including radiation therapy and surgery.

15 Examples of an antineoplastic agent include, in general, microtubule-stabilizing agents (such as paclitaxel (also known as Taxol[®]), docetaxel (also known as Taxotere[®]epothilone A, epothilone B, desoxyepothilone A, desoxyepothilone B or their derivatives); microtubule-disruptor agents; alkylating agents, anti-metabolites; epidophyllotoxin; an antineoplastic enzyme; a topoisomerase inhibitor; procarbazine;
20 mitoxantrone; platinum coordination complexes; biological response modifiers and growth inhibitors; hormonal/anti-hormonal therapeutic agents and haematopoietic growth factors.

Example classes of antineoplastic agents include, for example, the anthracycline family of drugs, the vinca drugs, the mitomycins, the bleomycins, the cytotoxic nucleosides, the taxanes, the epothilones, discodermolide, the pteridine family of drugs,
25 diynenes and the podophyllotoxins. Particularly useful members of those classes include, for example, doxorubicin, carminomycin, daunorubicin, aminopterin, methotrexate, methopterin, dichloro-methotrexate, mitomycin C, porfiromycin, Herceptin[®], Rituxan[®], 5-fluorouracil, 6-mercaptopurine, gemcitabine, cytosine arabinoside, podophyllotoxin or podo-phyllotoxin derivatives such as colchicines, etoposide, etoposide phosphate or
30 teniposide, melphalan, vinblastine, vincristine, leurosidine, vindesine, leurosine, paclitaxel and the like. Other useful antineoplastic agents include estramustine, cisplatin, carboplatin, cyclophosphamide, bleomycin, tamoxifen, ifosamide, melphalan, hexamethyl melamine, thiotepa, cytarabin, idarubicin, trimetrexate, dacarbazine, L-asparaginase, camptothecin, CPT-11, topotecan, ara-C, bicalutamide, flutamide, leuprolide, pyridobenzoindole
35 derivatives, interferons and interleukins. The preferred class of antineoplastic agents is the taxanes and the preferred antineoplastic agent is paclitaxel.

Radiation therapy, including x-rays or gamma rays that are delivered from either an externally applied beam or by implantation of tiny radioactive sources, may also be used in

5 combination with the compounds of this invention alone to treat cancer.

EXAMPLES

The following preparations and examples are given to enable those skilled in the art to more clearly understand and to practice the present invention. They should not be considered
 10 as limiting the scope of the invention, but merely as being illustrative and representative thereof.

Synthetic Examples

Example 1

15 **Synthesis of *N*-hydroxy-4-(3-methoxyphenyl)benzamide**

Step 1

20 To a prestirred solution of ethyl 4-bromo benzoate (1.2g, 5.2 mmol) and tetrakis(triphenylphosphine)palladium(0) (0.3g, 0.3 mmol) in toluene (15 ml) and ethanol (3 ml) (30 minutes) was added 3-methoxyphenylboronic acid (1.2 g, 7.8 mmol) and K₂CO₃ (3.6 g, 26 mmol). The resulting slurry was heated to 75 °C for 3 hr then cooled to room temperature and diluted with ether (200 ml) and washed with water (300 ml). The organic layer was dried (MgSO₄), filtered and concentrated to a brown oil. Flash chromatography (10% ethyl acetate/hexanes) provided 0.97 g (73%) of ethyl 4-(3-methoxyphenyl)benzoate as a white solid.
 25

Step 2

30 To a solution of ethyl 4-(3-methoxyphenyl)benzoate (0.97g, 3.8 mmol) in methanol (20 ml) and THF (10 ml) was added NaOH (0.8g dissolved in 5 ml of H₂O). The solution was stirred 6 hr at room temperature, then acidified to pH = 2 with 1N HCl, diluted with H₂O (150 ml) and extracted into ethyl acetate (150 ml). The organic layer was dried (MgSO₄), filtered and concentrated to collect 0.79 g (92%) of 4-(3-methoxyphenyl)benzoic acid as a white solid.

Step 3

35 To a solution of 4-(3-methoxyphenyl)benzoic acid (~0.3g, 1.5 mmol) and DMF (3 drops) in THF (10 ml) was added oxalyl chloride (0.26 ml, 3 mmol). After stirring the solution

5 for 45 minutes at room temperature, the solvent was removed *in vacuo* and then the resulting oil was dried under high vacuum. The oil was dissolved in THF (10 ml), cooled with an ice bath and then 50% aq. hydroxylamine (3 ml) was added. The cooling bath was removed and the light orange solution was stirred 30 minutes at room temperature. The reaction solution was then diluted with 1N HCl (100 ml) and extracted with ethyl acetate (100 ml). The solvent
10 was dried ($MgSO_4$), filtered and concentrated to give the title compound in a 78% yield. 1H NMR (DMSO - d_6): 11.25 (1H, s), 9.05 (1H, s), 7.82 (2H, d, $J = 8.4\text{Hz}$), 7.74 (2H, d, $J = 8.4\text{Hz}$), 7.39 (1H, t, $J = 7.7\text{Hz}$), 7.25 (2H, m), 6.96 (1H, m), 3.82 (3H, s); MS: 244.4 (M+1); 242.4 (M-1).

To a solution of ethyl 4-(3-nitrophenyl)benzoate (0.5 g, 1.8 mmol) in methanol (20 ml) was added NaOH (0.8 g dissolved in 7 ml of H₂O). The solution was stirred 6 hr at room temperature, then acidified to pH = 2 with 1N HCl, diluted with H₂O (150 ml). The resulting white solid was collected by filtration and dried under high vacuum to provide 0.39g (87%) 4-(3-nitrophenyl)benzoic acid.

After stirring 12 hr at room temperature, the solution was diluted with ethyl acetate (300 ml) and washed with 1N HCl (2 X 200 ml), then mild NaHCO₃ (2 X 200 ml). The organic layer was dried (MgSO₄), filtered and concentrated to collect 3.4 g (98%) of %) *N*-*tert*-butoxy-4-(3-nitrophenyl)benzamide.

5 Concentration of the solvent resulted in the isolation of 0.42 g (96%) of *N*-*tert*-butoxy-4-(3-aminophenyl)benzamide.

Step 4A

To a solution of *N*-*tert*-butoxy-4-(3-aminophenyl)benzamide (0.10 g, 0.35 mmol) and TEA (0.25 ml) in THF (5 ml) was added 3,4-dichlorobenzoyl chloride (77 mg, 0.37 mmol).

Example 12

Synthesis of *N*-hydroxy-4-(6-fluoro-4-phenoxy-1*H*-benzoimidazol-2-yl)-benzamide

30

Step 1

To a solution of 1,3,5-trifluoro-2-nitrobenzene (2.2 ml, 19 mmol) in THF 75 ml was added ammonium hydroxide (2 ml). After stirring 16 hr at room temperature, the THF was 35 evaporated and the residue was diluted with ethyl acetate (250 ml) and washed with brine (300

5 ml). The organic layer was dried ($MgSO_4$), filtered and concentrated to collect 3.2 g (~100%) of 2-nitro-3,5-difluorophenylamine as an orange solid.

Step 2

To a prestirred (25 min. at room temperature) slurry of phenol (0.26 g, 2.7 mmol) and sodium hydride (70 mg, 2.7 mmol) in THF (14 ml) was added 2-nitro-3,5-difluorophenylamine (0.43 g, 2.5 mmol) dissolved in THF (2 ml). After stirring 8 hr at room temperature, the brown solution was diluted with ethyl acetate (100 ml) and washed with H_2O (100 ml) and then brine (100 ml). The organic layer was dried ($MgSO_4$), filtered and concentrated to collect 0.52 g (84%) of 5-fluoro-2-nitro-3-phenoxyphenylamine as an orange solid.

Step 3

A solution of 5-fluoro-2-nitro-3-phenoxyphenylamine (0.52 g, 2.1 mmol) and palladium hydroxide (70 mg) in methanol (30 ml) was stirred at room temperature and subjected to atmospheric hydrogen for 4 hr. The catalyst was then removed by filtering the reaction slurry through celite. The solvent was removed *in vacuo* to collect 0.46 g of a green semi-solid. The resulting green solid was redissolved in methanol (20 ml) and to this was added methyl 4-formyl benzoate (0.35g, 2.1 mmol) and sodium metabisulfite (0.6g, 3.1 mmol). The solution was refluxed for 45 min, then cooled to room temperature and diluted with ethyl acetate (150 ml) and washed with sat. $NaHCO_3$ (200 ml). The organic layer was dried ($MgSO_4$), filtered and concentrated to collect a brown solid. Flash chromatography (25% ethyl acetate/hexanes) provided 0.51 g (68%) of 4-(4-benzyloxy-6-fluoro-1*H*-benzimidazol-2-yl)benzoic acid methyl ester as a light orange solid.

Step 4

To a solution of 4-(4-benzyloxy-6-fluoro-1*H*-benzimidazol-2-yl)-benzoic acid methyl ester (0.34 g, 0.94 mmol) in THF (5 ml) and methanol (10 ml) was added KOH (0.26 g in 2 ml of H_2O). After 4 hr at room temperature, the pH of the solution was adjusted to ~5 and then it was extracted with ethyl acetate (100 ml). The organic layer was dried ($MgSO_4$), filtered and concentrated to collect a brown solid. The resulting crude acid (0.23g, 0.66 mmol) was stirred in THF (10 ml) at room temperature and to this was added TEA (0.46 ml, 3.3 mmol) and thionyl chloride (0.06 ml, 0.86 mmol). After 4 hr at room temperature, the THF was removed *in vacuo*, and the resulting residue was dried under high vacuum. The residue was stirred in THF (3 ml) and to this was added hydroxylamine (1ml, 50% aq. solution). After stirring 30 min at room temperature, the solution was diluted with ethyl acetate (50 ml) and washed with H_2O (100 ml). The organic layer was dried ($MgSO_4$), filtered and concentrated to collect a brown solid. The solid was dissolved in THF (2 ml) and precipitated into ethyl acetate/ether

5 (20ml/20ml). The resulting tan solid was collected by filtration to provide 0.15 g (63%) of *N*-hydroxy-4-(6-fluoro-4-phenoxy-1*H*-benzoimidazol-2-yl) benzamide. ¹H NMR (DMSO - d₆) : 9.13 (1H, br s), 8.24 (2H, d, J = 8.4 Hz), 7.89 (2H, d J = 8.4 Hz), 7.26 (6H, m), 6.47 (1H, dd, J = 11.1 Hz, 2.2 Hz); MS: 362.2 (M-1), 364.0 (M+1).

Example 14

Synthesis of *N*-hydroxy-4-[3-(benzoylaminomethyl)phenyl]benzamide

Step 1

To a pre-stirred (30 min) solution of (3-bromobenzyl)-carbamic acid benzyl ester (2.2g, 6.8 mmol) and tetrakis(triphenylphosphine)palladium(0) (0.24g, 0.2 mmol) in toluene (50 ml)
35 and methanol (10 ml) was added (4-methoxycarbonylphenyl)boronic acid (1.3 g, 7.2 mmol)

5 and K₂CO₃ (4.7 g, 34 mmol). The resulting slurry was heated to 75 °C for 3 h, then cooled to room temperature and diluted with ethyl acetate (200 ml) and washed with water (300 ml). The organic layer was dried (MgSO₄), filtered and concentrated to a brown oil. Flash chromatography (25% ethyl acetate/hexanes) provided 1.9 g (74%) of 3'-(benzyloxycarbonylaminomethyl)-biphenyl-4-carboxylic acid methyl ester as a white solid.

10 Step 2

To a solution of 3'-(benzyloxycarbonylaminomethyl)-biphenyl-4-carboxylic acid methyl ester (0.5g, 1.3 mmol) in methanol (10 ml) and THF (3 ml) was added NaOH (0.6g dissolved in 5 ml of H₂O). The solution was stirred 2 h at room temperature, then acidified to pH = 2 with 1N HCl, diluted with H₂O (150 ml) and extracted into ethyl acetate (150 ml). The 15 organic layer was dried (MgSO₄), filtered and concentrated to collect 0.47 g (98%) of 3'-(benzyloxycarbonylaminomethyl)-biphenyl-4-carboxylic acid as a white solid and this material was taken forward without further purification.

Step 3

20 To a solution of 3'-(benzyloxycarbonylaminomethyl)-biphenyl-4-carboxylic acid (0.47 g, 1.3 mmol), *O*-*tert*-butylhydroxylamine hydrochloride (0.2 g, 1.6 mmol) and TEA (0.9 ml) in DMF (10 ml) was added BOP reagent (0.63 g, 1.4 mmol). After stirring 3 h at room temperature, the solution was diluted with ethyl acetate (100 ml) and washed with 1N HCl (2 X 100 ml), then mild NaHCO₃ (2 X 100 ml). The organic layer was dried (MgSO₄), filtered and concentrated. Flash chromatography (40% ethyl acetate/hexane) provided 0.47 g (82%) of 25 (4'-*tert*-butoxycarbamoyl-biphenyl-3-ylmethyl)-carbamic acid benzyl ester as a white solid.

Step 4

30 A mixture of (4'-*tert*-butoxycarbamoyl-biphenyl-3-ylmethyl)-carbamic acid benzyl ester (0.47 g, 1.1 mmol) and palladium (10% on charcoal, 50 mg) in methanol (15 mL) was stirred under a hydrogen atmosphere for 35 min and then the suspension was filtered through a plug of celite to remove the palladium. Concentration of the solvent resulted in the isolation of 0.33 g (100%) of crude 3'-aminomethyl-biphenyl-4-carboxylic acid *tert*-butoxy-amide.

Step 5

35 To a solution of 3'-aminomethyl-biphenyl-4-carboxylic acid *tert*-butoxy-amide (0.10 g, 0.34 mmol), benzoic acid (50 mg, 0.4 mmol) and TEA (0.4 mL) in DMF (2 mL) was added BOP reagent (0.16 g, 0.37 mmol). The solution was stirred 45 minutes at room temperature, then diluted with ethyl acetate (75 ml) and washed with 1N HCl (2 X 100 ml), then mild NaHCO₃ (2 X 100 ml). The organic layer was dried (MgSO₄), filtered and concentrated to collect a white foam. To the foam was added 30% HBr/acetic acid (2 mL). After 30 minutes of

5 stirring at room temperature, the reaction solution was concentrated under vacuum, and the resulting solid was subjected to reverse phase HPLC to provide 98 mg (83%) of the title compound.

Example 20

Synthesis of acetyl-Gly-Ala-(*N*-acetyl-Lys)-AMC

tert-Boc (*N*-Acetyl-Lys)-AMC (445 mg, 1 mmol, purchased from Bachem) was dissolved in 4 M HCl in dioxane to provide *H*-(*N*-acetyl-Lys)-AMC as a white solid. To a solution of *H*-(*N*-acetyl-Lys)-AMC in DMF (5 ml) was added Ac-Gly-Ala-OH (188 mg, 1 mmol) using PyBOP (520 mg, 1 mmol), HOBr (135 mg, 1 mmol), and NMM (0.296 ml, 2 mmol). The reaction mixture was stirred for 1 h and monitored by MS/LC for the presence of *H*-(*N*-acetyl-Lys)-AMC. Additional amounts of PyBOP (260 mg, 0.5 mmol), HOBr (70 mg, 0.5 mmol), and NMM (0.146 ml, 1 mmol) was added and the stirring was continued for additional 4 h after which the product was isolated in quantitative yield.

Biological Examples

Example 1

Inhibition of HDAC *in Vitro*

35 The HDAC inhibitory activity of the compounds of this invention *in vitro* was determined as follows.

Measurements were performed in a reaction volume of 100 μL using 96-well assay plates. HDAC-1 (200 pM final concentration) in reaction buffer (50 mM HEPES, 100 mM

5 KCl, 0.001% Tween-20, 5% DMSO, pH 7.4) was mixed with inhibitor at various concentrations and allowed to incubate for 30 minutes, after which trypsin and acetyl-Gly-Ala-(*N*-acetyl-Lys)-AMC were added to final concentrations of 50 nM and 25 μ M, respectively, to initiate the reaction. Negative control reactions were performed in the absence of inhibitor in replicates of eight.

10 The reactions were monitored in a fluorescence plate reader. After a 30 minute lag time, the fluorescence was measured over a 30 minute time frame using an excitation wavelength of 355 nm and a detection wavelength of 460 nm. The increase in fluorescence with time was used as the measure of the reaction rate. Inhibition constants were obtained using the program BatchKi (Kuzmic et al. *Anal. Biochem.* 2000, 286, 45-50).

Example 2

Cell proliferation assay *in Vitro*

The ability of the compounds of Formula I to inhibit growth of tumor cells *in vitro* was determined as follows.

20 Stock cultures of the DU 145 prostate carcinoma cell line were maintained in RPMI medium 1640 containing 10%(v/v) fetal bovine serum, 2 mM L-glutamine, 1 mM sodium pyruvate, 50 units/ml penicillin, and 50 μ g/ml streptomycin at 37°C in 5% CO₂ humidified atmosphere. Cells were cultured in 75-cm² culture flasks and subcultures were established every 3 to 4 days so as not to allow the cells to exceed 90% confluence.

25 DU 145 cells were harvested for proliferation assays by trypsinization (0.05% trypsin/0.53 mM EDTA), washed twice in culture medium, resuspended in appropriate volume of medium, and then counted using a hemacytometer. Cells were seeded in wells of flat-bottom 96-well plates at a density of 5,000 cell/well in 100 μ l. Cells were allowed to attach for 1.5 to 2 hours at 37°C.

30 Compounds were diluted from 10 mM stock solutions in DMSO. Serial 3-fold dilutions were performed in medium containing 0.6% DMSO in wells (in triplicate) of a 96-well U-bottom plates starting with a 60 μ M solution. After dilutions were completed, 100 μ l of each compound dilution (in triplicate) was transferred to designated triplicate wells of the 96-well plate containing cells in 100 μ l of medium. Final concentrations of the dose-response for compounds in assay plates ranged from 0.12 to 30 μ M. Control wells (cells with no treatment) received 100 μ l of 0.6% DMSO in culture medium. Wells containing medium with no cells served as the background wells. Cells were cultured with the compounds for 48 and 72 hours at 37 °C in a humidified CO₂ incubator.

5 Cell proliferation was assessed by measuring fluorescence after the addition of the fluorogenic redox indicator, Alamar Blue™ (BioSource International). Ten μ l of Alamar Blue™ was added to each well of the 96-well plate(s) 3 to 4 hours prior to the end of the incubation period. Assay plates were read in a fluorescence plate reader (excitation, 530 nM; emission, 620 nM). G_{50} values (concentration at which the growth of the tumor cells was
10 inhibited by 50%) for compounds were determined by plotting the percent control fluorescence against the logarithm of the compound concentration. The compounds of this invention inhibited the growth of the tumor cells.
